Ebuka
This lab helped me understand why data needs to be prepared before it can be used in a machine learning model. I learned about filling missing values with the median, converting categories into numerical columns through One-Hot Encoding, and scaling numerical features. I learned that the median is useful because extreme values affect it less than other metrics. I also gained a better understanding of why some models benefit from feature scaling, while Decision Trees generally do not need it. Overall, this assignment showed me that preparing data is an important part of building a useful model.

It was a great hands-on learning experience that strengthened my understanding of data preprocessing and preparation for machine learning. Working with the Titanic dataset helped me appreciate how important data quality is when building reliable models. I gained practical experience using Pandas to explore datasets, handle missing values, encode categorical features, and standardize numerical data. One of my biggest takeaways was realizing that raw data is rarely ready for machine learning and that proper preprocessing plays a crucial role in model performance. Overall, this module boosted my confidence in working with real-world datasets and strengthened my Python data analysis skills.
