ML Lab 05

Ebuka

This lab helped me understand why data needs to be prepared before it can be used in a machine learning model. I learned about filling missing values with the median, converting categories into numerical columns through One-Hot Encoding, and scaling numerical features. I learned that the median is useful because extreme values affect it less than other metrics. I also gained a better understanding of why some models benefit from feature scaling, while Decision Trees generally do not need it. Overall, this assignment showed me that preparing data is an important part of building a useful model.
